

Solano de Zuasnabar

AI Engineer | Data Scientist

[LinkedIn](#) | [GitHub](#) | [Portfolio](#)

Location: Yerba buena, Tucumán - Argentina

Number: 3816640453

Email: solanodz.dev@gmail.com

Birth Date: 07/06/2000

About me

AI Engineer with experience on building and deploying production-grade AI systems, from LLM-powered backends and RAG pipelines to computer vision and automation workflows. Comfortable working autonomously in fast-moving environments, taking ownership from prototype to production and iterating based on real usage and stakeholder feedback. Strong Python background covering API development, ML/AI pipelines, NLP, embedding-based search, and vector databases. Curious technologist who enjoys understanding how things work at every level of the stack.

Experience

AI Engineer - Develative (freelance)

Vento Ventures | 11/2025 - 01/2026

Venture capital startup. Built AI-driven automation workflows to support an internal investment management platform.

- **Startup Onboarding Automation:** Designed Zapier automations triggered by Gmail labels to process portfolio company emails, extract structured data from bodies and attachments (contracts, banking documents) via OpenAI API, and create startup records through POST requests to a custom backend.
- **Real-time Data Sync:** Built a metrics update workflow using PATCH requests — identifying startups by domain and automatically syncing KPIs to the web interface in real time.

AI Engineer - Tecnología BI

Blue Star Group (Isadora y Todomoda) | 06/2024 - Present

Design and deployment of AI solutions for a large retail group, with direct client contact and ownership across the full cycle: prototyping → production → iteration.

- **RAG / LLM Chatbot:** Designed and built an AI-powered chatbot (Integra) integrating n8n workflows with a SQL Server backend. Implemented webhook-based request handling, conversational memory via Redis, a custom dynamic SQL query tool, and multi-format output (PDF/Excel) — enabling real-time financial reporting for internal users.
- **Semantic & Visual Search:** Built an image-based SKU similarity search system combining computer vision with a vector database (text + image embeddings), real-time stock lookup, and Google Maps integration via WhatsApp.
- **Predictive ML:** Implemented an ML model to predict new store profitability using geographic, demographic, and commercial variables, directly informing expansion decisions.
- **NLP & Generative AI:** Applied OpenAI APIs for automated resume screening and product description classification.

- **Collaboration:** Worked cross-functionally with BI, IT, and expansion teams to align solutions with real business needs and measurable impact.
-

Knowledge and tools

- **Languages:** Python (primary), JavaScript / TypeScript
- **AI / ML:** LLMs (OpenAI API), LangChain, RAG pipelines, embeddings, fine-tuning, inference pipelines, model evaluation & monitoring
- **NLP:** Semantic search, product/text classification, resume analysis, conversational memory (Redis)
- **Vector DBs:** Pinecone, Chroma, Qdrant — hybrid text + image search
- **Backend APIs:** FastAPI, Flask — production REST APIs with webhooks and POST/PATCH integrations
- **ML Libraries:** scikit-learn, TensorFlow, PyTorch, pandas, numpy
- **Databases:** SQL Server (daily), Supabase / PostgreSQL, MongoDB (basic), Redis
- **Frontend:** Next.js, Zustand, TanStack Query
- **Automation:** n8n, Zapier — multi-step AI-driven workflow automation
- **Tooling:** Docker, Git/GitHub, Postman, Cursor IDE, Roboflow, MCP servers
- **Cloud:** Azure (basic), Google Cloud Platform (basic)

Additional Technical Experience

- Built and deployed RAG chatbots end-to-end: document ingestion, chunking, embedding management, vector store integration, and LLM response generation.
 - Web scraping pipelines using BeautifulSoup and requests for data collection and enrichment.
 - MCP server integrations to connect AI models with external tools and data sources.
 - Personal projects using Supabase (PostgreSQL-based) for backend data management.
-
